Lab 4: VibeCoding

Final Submission Report — Tug of War

Assigned repository: https://github.com/SETAPESU26/56_tug_of_war

Personal GitHub account: DharshiniPES

Personal repository URL (verify that the fork is public and current):
https://github.com/DharshiniPES/56_tug_of_war

Student: Dharshini V **SRN:** PES1UG24AM428

Objective

Use a VibeCoding assistant to inspect and repair the assigned Python game, add the requested features from the repository README, test the changes, and push the updated code to a personal GitHub repository.

Feature checklist

Task	Required behavior	Verification status
1. Keyboard input	Rapid alternating A/D pulls do not deadlock; holding a key does not keep pulling	Not independently verified here
2. AI panic surge	AI reacts faster/pulls harder when the marker approaches the player's winning boundary	Not independently verified here
3. Animations	Rope tension/sag or vibration and puller leaning animate during play	Not independently verified here
4. Timer / sudden death	45-second timer; sudden death state and doubled pulling power if not over	Not independently verified here

Testing procedure

Run the project from its root folder with `python main.py`. Confirm the keyboard controls, AI surge behavior, animations, 45-second timer, sudden-death multiplier, and restart behavior. Record the final video only after the features have been observed working.

Git and repository verification

The submission instructions require the code to be pushed to the student's personal repository and separate commits for each task. Verify with `git remote -v`, `git log --oneline`, and `git status`. The assistant cannot verify the contents of the user's local repository from this document.

Deliverables checklist

■ Before video (10 seconds, recorded before edits)

■ After video (10 seconds, recorded after testing)

■ Updated source code in the personal GitHub repository

■ Chat history PDF / document

■ Separate commits for each task

■ All items placed under the Lab-4 folder in the lab submission repository

Accuracy note: This report is a submission aid. Feature completion and test results must be confirmed by running the actual project. Do not represent untested features as verified.
